ABSTRACT:

A method of stabilizing organic substrate materials having an absorption

 $\overset{\,\,{}_\circ}{\text{maximum}}$ in the wavelength region of about 300 nm to about 800 nm to light which

comprises making coexist with the organic substrate at least one metal $\operatorname{complex}$

salt represented by the following general formula (I): #STR1## wherein Cat

represents a divalent or a monovalent cation, and n is 1 or 2. A photographic

material thus stabilized is also disclosed.

Exemplary Claim Number: 8

BRIEF SUMMARY:

- (1) BACKGROUND OF THE INVENTION
- (2) 1. Field of the Invention
- (3) The present invention relates to the stabilization of organic substrate

materials to exposure to light and particularly, to the stabilization or

organic dyestuffs for exposure to light. More particularly, the present

invention relates to stabilizing organic substrate materials in the form of

photographic dye images and to novel photographic elements so
